Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.

Disclosure; Page 38-39; 40pp; English.

The present sequence represents a modified human erythropoietin (EPO) protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The

Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.

```
specification describes a conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (hEPO) or its analogues (where hEPO is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycoprotein is covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein is no vivo biological activity of causing bone marrow cells to increase production of reticulocytes and red blood cells. The conjugate increased circulating half-life and plasma reabidence time, decreased clearance, increased clinical activity in vivo, improved potency and stability, when compared to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRF), acquired immunodeficiency syndrome (AIDS) and for treating cancer patients immunodeficiency syndrome (AIDS) and for treating patients by stimulating the division and differentiation of committed erythroid progenitors in the bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 RMEVGQQAVEVWQGLALLSEAVLRGQALLVNSSQPWEPLQLHVDKAVSGLRSLTTLLRAL 120

The present sequence represents a modified human erythropoietin (EPO) protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The state of secrification describes a conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (hEPO) or its analogues (where hEPO is modified by addition of 1-6 glycoprotein is covalently linked to a poly(cetylend elycol) group. The glycoprotein is covalently linked to a poly(cetylend elycol) group. The EPO glycoprotein production of reticulocytes and red blood cells. The conjugate increased circulating half-life and plasma regidence time, decreased clearance, increased clinical activity in vivo, improved potency and stability, when comparated to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRF), acquired immunodeficiency syndrome (AIDS) and for treating cancer patients cundergoing chemotherapy. It is also useful for treating patients by stimulating the division and differentiation of committed erythroid progenitors in the bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0

The present sequence tepperature number at protecting teach, protein. The EPO was extended at the N-terminal by a proteclytic cleavage site. It was used to produce conjugates of the invention. The specification describes a conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (hEPO) or its analogues (where hEPO is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycoprotein is covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein has in vivo biological activity of causing bone marrow cells to increased circulating half-life and plasma residence time, decreased clearance, increased clinical activity in vivo, improved potency and stability, when compared to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRF), acquired in munderficients (TRF) and prophylaxis of diseases correlated with munderficients (TRF) and prophylaxis of diseases or the propertients (TRF) and propertients (TRF) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RMEVGQQAVEVWQGLALLSEAVLRGQALLVNSSQPWEPLQLHVDKAVSGLRSLTTLLRAL 120

The present sequence represents a modified human erythropoietin (BPO)

protein. The EPO was extended at the N-terminal by a proteolytic cleavage

site. It was used to produce conjugates of the invention. The

specification describes a conjugate comprising an EPO glycoprotein having

an N-terminal alpha-amino group, chosen from human EPO (BEPO) or its

analogues (where hEPO is modified by addition of 1-6 glycoprotein is

or a rearrangement of a glycosylation site). The glycosylation sites

or a rearrangement of a glycosylation site). The glycoprotein is

covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein

covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein

bas in vivo biological activity of causing bone marrow cells to increased

circulating half-life and plasma residence time, decreased clearance,

increased clinical activity in vivo, improved potency and stability, when

compared to unmodified EPO. The EPO conjugate is useful for preparing

medicaments for the treatment and prophylaxis of diseases correlated with

anaemia in chronic renal failure patients (CRF), acquired

mundodeficiency syndrome (AIDS) and for treating cancer patients

undergoing chemotherapy. It is also useful for treating patients by

stimulating the division and differentiation of committed erythroid

progenitors in the bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel conjugate of erythropoietin glycoprotein with polyethylene glycol, useful for treating diseases correlated with anemia in chronic renal failure patients and acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tischer W;

                                                                                                                                                                                                                                                                                               Protein
   The present sequence is the oligopeptide GST-Epo, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS

(first entry)

/note= "EPO protein"

```
The present sequence represents a modified human erythropoietin (EPO)

protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The clear specification describes a conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (NEPO) or its analogues (where hEPO is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycoprotein is covalently linked to a poly(ethylene glyco) group. The EPO glycoprotein covalently linked to a poly(ethylene glyco) group. The EPO glycoprotein site in vivo biological activity of causing bone marrow cells to increase circulating half-life and plasma residence time, decreased clearance, increased clinical activity in vivo, improved potency and stability, when compared to unmodified BPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaend in chronic renal failure patients (GRF), acquired immunodeficiency syndrome (AIDS) and for treating cancer patients or immunodeficiency syndrome (AIDS) and for treating patients by stimulating the division and differentiation of committed erythroid compared in the bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7;

Large amounts of EPO may be obtained using recombinant DNA techniques in contrast to small amounts obtained from plasma and urine. This sequence is expressed in 8. cerevisiae.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein. The EPO was extended at the N-terminal by a proteolytic cleavage site. It was used to produce conjugates of the invention. The specification describes a conjugate comprising an EPO glycoprotein having an N-terminal alpha-amino group, chosen from human EPO (hEPO) or its analogues (where hEPO is modified by addition of 1-6 glycosylation sites or a rearrangement of a glycosylation site). The glycoprotein is covalently linked to a poly(ethylene glycol) group. The EPO glycoprotein chas in vivo biological activity of causing bone marrow cells to increase production of reticulocytes and red blood cells. The conjugate increased circulating half-life and plasma residence time, decreased clearance, increased clinical activity in vivo, improved potency and stability, when compared to unmodified EPO. The EPO conjugate is useful for preparing medicaments for the treatment and prophylaxis of diseases correlated with anaemia in chronic renal failure patients (CRF), acquired

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an aerosol which comprises a conjugate of a therapeutic agent and neonatal Fc receptor (FcRn) binding partner. The particles in the aerosol have a mass median aerodynamic diameter (MMAD) of at least 3 micro m. The aerosol can be used for the systemic delivery of a therapeutic agent (e.g. antigen (e.g. tumour antigen), polypeptide, oligonucleotide (e.g. antisense oligonucleotide), erythropoietin, growth hormone, interferon-alpha, interferon-beta and follicle stimulating hormone). The present sequence is a protein used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   79

```
c delivery of a therapeutic agent. The method involves administering an effective amount of an aerosol of a therapeutic agent (especially an antibody) and a neonatal For teceptor (FCRN) binding partner to the lungs cuch that a central lung zone/peripheral lung zone deposition ratio (C/P ratio) is 0.7 or more. Human FCRN is expressed in adult epithelial tissues, and provides a receptor-specific mechanism for transport across on epithelial barrier. Its expression has been found to be more extensive in central airways than in the periphery of the lung. The invention also relates to an aerosol of a conjugate of a therapeutic agent and an FCRN binding partner, where the aerosol particles have a mass median erodynamic diameter (MMAD) of 3 micrometres or more; an aerosol delivery system; and method for its manufacture. The method can be used to system; and a method for its manufacture. The method can be used to apthelium. Such therapeutic agents include oligonucleotides (including antisense oligonucleotides) or proteins such as antigens (epocially cumour antigens), erythropotetin (EPO), growth hormone, interferon-alpha (IFN-alpha), interferon-beta (IFN-beta), follicle stimulating hormone (FSH) and especially therapeutic or dagnostic antibodies. Therapeutic antibodies that may be administered using the method of the invention may be used to treat deep ung diseases such as RSV pneumonia, cytomegalovirus (CWN) pneumonia, virumity, SYNAGIS, RITUKAN, HERCEPTIN and CEA-CIDE. Therapeutics administered using the method of the invention may be used to treat deep ung diseases such as RSV pneumonia, cytomegalovirus (CWN) pneumonia, cytomegalovirus (CWN) and autoimmune diseases such as such as cancer and allogaraft rejection; and autoimmune diseases chosen from rheumatoid arthritis and cromprising the KPb signal peptide, human EPO and the human IgG1 FC comprising the KP signal peptide, human EPO and the human IgG1 FC comprising the Residual peptide, human EPO and the human IgG1 FC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VGQQAVEVWQGLALLSEAVIRGQALLVNSSQPWEPLQLHVDKAVSGLRSLTTLLRALGAQ 123

glycosylated erythropoietin (EPO) analogues, where the lyaine at position 45 and/or 116 has been replaced with an amino acid that cannot be pegylated. The non-glycosylated EPO analogues of the invention are useful for treating anaemia. The present amino acid sequence represents a non-glycosylated EPO analogue with a modified protease B signal peptide. NOTE: The present sequence is included in the sequence listing as SEQ ID No 29, however another sequence on page 28 of the specification is also shown as SEQ ID No 29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 RMEVGQQAVEVWQGLALLSEAVLRGQALLVNSSQPWEPLQLHVDKAVSGLRSLTTLLRAL 120

                                                                                                               All of the Cys residues in the SQ are labelled "SH". Megakaryocyte-platelet growth factor contains human EPO as an active principle. Human EPO has a megakaryocyte colony-stimulating activity and increases the ratio of small acetyl cholinesterase positive cell (SAchE+) which is immature megakaryocyte- Human EPO effects megakaryocyte-platelet system other than an erythrocyte growth effect. Megakaryocyte-platelet growth is usable as a remedy for diseases caused by a platelet decrease

human erythropoietin (EPO). EPO leads to the maturation of erythrocytes and is therefore designated as a late myeloid differentiation factor (MDF). Within the scope of the invention hybrid molecules were produced which contain at least a portion of an early MDF and at least a portion of a late MDF covalently linked. The EPO sequence given is effective within the scope of the invention in full or in a truncated version.

In an acids 7-161 act as a late MDF when recombined with an early MDF eg. IL-3. These compounds can be used to promote heamatopoiesis in a patient. The bonding of the early and late factors allows a very high conc. of late MDF at the surface of a cell which the early MDF is bound. It also allows the early MDA to act more specifically to stimulate only the allows the late in the surface of a cell which the early MDF is bound. It also allows the early MDA to act more specifically to stimulate only the useful for treating anaemias of various origins eg. These compounds are useful for treating anaemias of various origins eg.renal failure and ADDS. It is easier to produce and administer one recombinant molecule

optionally 1-6 amino acids from the N-terminus and 1-5 from the C-terminus can be deleted, (b) the N-terminus is joined to the C-terminus directly or through a linker (see AAW89405-12) capable of joining the N-terminus to the C-terminus, (c) there are new C- and N-termini at any two consecutive amino acids from amino acids 23-24 to 38-39, 40-41 to 41-42, 43-44 to 48-49, 50-51 to 57-58, 77-78 to 82-83, 84-85 to 88-89, and 108-109 to 131-132, and (d) optionally the agonist polypeptide is preceded by Met, Ala, or Met-Ala. 60 of these circularly permuted EPO receptor agonists (see AAW58413-72) are claimed. Also claimed are: nucleic acid molecules (see AAW58413-72) are claimed. Also claimed are: nucleic acid method of producing an EPO receptor agonist using transfected host cells; and methods for stimulating the production of haematopoietic cells, for selective ex vivo expansion of erythrosid progenitors, and treating patients having a haematopoietic disorder using the BPO receptor agonists. The RPO recent agonists the PPO recent agonists. the EPO receptor agonists. The EPO receptor agonists retain one or more activities of native EPO and may also show improved haematopoietic cellstimulating activity and/or an improved activity profile which may include reduction of undesirable biological activities associated with native EPO and/or have improved physical properties such as increased solubility, stability and refold efficiency Sequence 166 AA;

AAW77780 standard; protein; 166 AA.

AAW77780;

(first entry) 24-NOV-1998 Human BPO receptor agonist polypeptide.

Haematopoietic receptor agonist, erythropoietin receptor agonist, BPO, human; chimeric protein; stem cell expansion; tumour; infection; autoimmune disease; haematopoietic disorder; therapy; dendritic cell.

Multi-functional chimeric haematopoietic receptor agonist - useful to treat haematopoietic disorders, tumours, infections or autoimmune

A human erythropoietin (EPO) receptor agonist polypeptide comprises a modified EPO amino acid sequence of the formula provided in AAW7780, in which the N-terminus is joined to the C-terminus directly or via a linker, the polypeptide having new C- and N-termini at one of the constitutions indicated. Novel claimed multi-functional chimeric beamatopoietic receptor agonists (see AAW77812-22) have the formula R1-L1 erg. R2. R2.11-R1. R1-R2 or R2-R1, where L is a linker and R1 and R2 are independently selected from: (a) the human EPO receptor agonist; (b) a human stem cell factor receptor agonist polypeptide (see AAW77781); (c) a modified constitution factor (G-CSF) polypeptide (see AAW77783); (e) modified human interleukin-3 polypeptide (see AAW77784); (c) modified human interleukin-3 polypeptide (see AAW77784); (c) modified human interleukin-3 polypeptide (see AAW77784); (c) modified human consisting of a CSF, a cytokine, a factor selected from the group consisting of a CSF, a cytokine, a consisting and polypeptide (see AAW77785); (d) modified human at least R1 or R2 is selected from (a), (b) or (c) as above. The consisting of a tleast R1 or R2 is selected from (a), (b) or (c) as above. The consisting consisting of a consisting consisting of a consisting consi 1 APPRLICDSRVLERYLLEAKEAENITIGCAEHCSLNENITVPDIKVNFYAWKRMEVGQQA APPRLICDSRVLERYLLEAKEAENITTGCAEHCSLNENITVPDTKVNFYAWKRMEVGQQA 0 Score 851; DB 2; Length 166; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                         1 APPRIEGRAPPRLICDSRVL.......NFLRGKLKLYTGEACRIGDR 174
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 30,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C.Comment: Erythropoietin is produced by kidney or liver of adult mammals and by liver c; Function:
A.Pescription: the primary inducer of erythrocyte formation
C.Superfamily: erythropoietin
C.Superfamily: erythropoietin
C.Superfamily: erythropoietin
F.1-26/Domain: signal sequence #status predicted <SIG>
F.27-192/Product: erythropoietin #status predicted <AMI>

-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Produced by kidney or liver of adult mammals and by liver of fetal or neonatal mammals.
-!- SIMILARITY: Belongs to the EPO / TPO family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1; Gaps

"Erythropoietin structure-function relationships: high degree of
sequence homology among mammals.";
Blood 82:1570-1516(1993).
"C -1- FUNCTION: Erythropoietin is the principal hormone involved in the
regulation of erythrocyte differentiation and the maintenance of a
physiological level of circulating erythrocyte mass.

-1- SUBCELLULAR LOCATION: Secreted
-1- TISSUB SPECIFICITY: Produced by kidney or liver of adult mammals
-1- TISSUB SPECIFICITY: Produced by Ridney or liver of adult mammals
-1- SIMILARITY: Belongs to the EPO / TPO family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            69 VEVWQGLALLSEAVLRGQALLVNSSQPWEPLQLHVDKAVSGLRSLTTLLRALGAQKEAIS 128
